

Individual Report and Learning Reflection:

In our group work, my role was as the front-end developer and UI/UX designer. One of the first problems I encountered was that I was still struggling with coding so I searched on YouTube for basic tutorials and also used AI examples so I could learn little by little. There were many terms and elements that I did not fully understand yet, especially in CSS, such as padding and other properties, because I still did not know their exact purposes. Whenever my output did not match the design of the website, I asked for help from Xeed or used AI for guidance.

Despite that, I was still able to contribute to the coding of the CvSU and guest login, as well as the website design when we were brainstorming. When I did the guest login and CvSU login, I reused some of their previous codes whenever possible, especially when the layout or appearance was similar then I just followed the flow of their codes. Whenever there were CSS properties, sizes, or styles that I did not understand, I asked AI how to fix or adjust them so the website would look correct. Of course, I also continued helping with the project until it was finished.

What I learned from this group work is the importance of being responsible as a team member, helping the group complete tasks properly, and studying continuously so I would not always rely on others.
